Sequence 30706, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES

TITLE OF INVENTION: ARRIGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT FILLING DATE: 1099-02-18

PRIOR FILLING DATE: 1999-02-18

PRIOR PLILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PLILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 30706

LENGTH: 538
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30;

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the

Claim 27; Page 148-150; 156pp; English.

substrates.

Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon

```
control of regulatory sequences, and contacting the host cell with carbon substrate to produce a caroteenoid compound. The method is useful for producing caroteenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in the caroteenoid biosynthetic pathway and which metabolise single carbon substrates. The caroteenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The caroteenoids are also useful as infermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Rhodococcus erythropolis ANI2 beta-caroteen ketolase (Crt0) enzyme
                                                                                                                                                                                                                                                                                                                 used in the invention

```
The invention relates to a novel isolated nucleic acid encoding a carcenoid ketolase enzyme which: (i) encodes an amino acid sequence containing all six conserved motifies (Trio encodes as a fixed sequence containing all six conserved motifies (Trio encodes a sequence of Si2 amino acid of the inspecification, or (iii) hybridises to (i) or (ii). A nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is also useful for producing cyclic ketocarotenoid compounds. A chimeric gene is useful for regulating cyclic ketocarotenoid biosynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis; where the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis; where the carotenoid ketolase gene is expressed on a multicopy plasmid or is operably linked to a inducible or regulated promoter. Optionally the carotenoid ketolase gene is expressed in antisense orientation or is operably linked to a inducible or regulated promoter. Optionally the carotenoid ketolase gene is expressed in antisense orientation or is operably binsertion of foreign DNA into the coding region. The present sequence represents the R. erythropolis strain ANI2 crt0 polypeptide
                                                                                                                                                                                                                                                New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11 IVGEMBAFAPGFTDSVLDRFIQTPRDIBSELGMIGGNVMHVEMSLDQMMLWRPLPELSGH 480

Cheng Q, Tao L;

2003-300493/29. WPI; 2003-300493 N-PSDB; ABZ75461 New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.

Claim 15; Page 69-71; 90pp; English.

The invention relates to a novel isolated nucleic acid encoding a carotenoid ketolase enzyme which: (1) encodes an amino acid sequence containing all six conserved motifs of Crto enzymes of Rhodococcus erythropolis AN12 strain, Deinococcus radiodurans R1 strain, and scids, given in specification; or (iii) encodes a sequence of 532 amino acids, given in specification; or (iii) hybridises to (1) or (ii). A nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is also useful for producing cyclic ketocarotenoid compounds. A chimeric gene is useful for regulating cyclic ketocarotenoid biospynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biospynthesis; where the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biospynthesis; where the carotenoid ketolase gene is overexpressed on a multicopy plasmid or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotenoid biosynthesis may be down regulated, where the carotenoid ketolase gene is expressed in antisense orientation or is disrupted by insertion of foreign DNA into the coding region. The present sequence represents the D. radiodurans strain R1 crtO polypeptide

New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.

Disclosure, Page 72-74, 90pp, English.

The invention relates to a novel isolated nucleic acid encoding a carotenoid ketolase enzyme which: (i) encodes an amino acid sequence containing all six conserved motifs of CrtO enzymes of Rhodococcus erythropolis AN12 strain, Deinococcus radiodurans R1 strain, and

Human; full length cDNA; cDNA synthesis; oligo-capping.

Homo sapiens. EP1130094-A2 05-SEP-2001

cynechocystis Sp. Fuchaus strain, (11) encodes a sequence or size author conditions by the condition of the invention is useful for obtaining a nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is encoding a carotenoid ketolase enzyme. A nucleic acid of the invention is carotenoid ketolase enzyme. A nucleic acid of the invention is a size useful for producing cyclic kerocarotenoid biosynthesis in an organism by introducing cyclic kerocarotenoid biosynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis is regulated. The regulation may be upregulation of cyclic ketocarotenoid ketolase gene is overexpressed on a multicopy plasmid or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotenoid biosynthesis may be down regulated, where the carotenoid ketolase gene is expressed in antisense orientation or is disrupted by insertion of foreign DNA into the coding region. The present sequence represents the Synechocystis sp. strain PCC6803 crt0 polypeptide 121 241 GTGALTEALVKLVQAQGGKILTDQTVKRVLVENNQAIGVEVANGEQYRAKK----GVIS 295 291 TLD-----LLGNGGPDRTTLDHWRR-KIRVGPGIGAVLRL--ATSALPSYRGDATTRE 340 341 STSGLOLLUSDRAHLRTAHGAALAGELPPRPAVLGMSF-SGIDPTIAPAGRHQVTLWSQ- 398 :| |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: || |: WQPYRLSG-----HRDWA-SVARARADRIVGEMEAFAPGFTDSVLDRFIQTPRDIESE 450 KDADAYRRFVAVWSERSRHVMKAFSTPPTG-----SNLIGAFGGLATARGNSELS 171 GSGALSAALASRMAVDGATVALGDGVTSIR-RNSNHWTVTTESGREVHARKVIAGCHILT 290 296 NIDARRIFLOLVEPGALAKVNONLGERLERRTVNNNEAILKIDCALSGLPHFTAMAGP-E 354 61 64 Synechocystis sp. The invention relates to primers for synthesising full length cDNA clones. 330 cDNA molecules encoding a human protein have been isolated ben duclotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for Synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length not form part of the invention. Note: The sequence data for this patent did format directly from EPO

830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.

The proteins of the invention have cytostatic, neuroprotective, cardiant, immunosuppressive, antiinflammatory, neuroleptic, and endocrine activity. The polypeptide is used in the diagnosis and treatment of disorders associated with disorders include cancer, cell proliferative disorders, neurological, cardiovascular, autoimmune/inflammatory and metabolic disorders. New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

Claim 20; SEQ ID NO 1614; 1185pp; English

RESULT 8

The invention relates to 971 novel human CDNA sequences (ADC29919-ADC3089) and the polypeptides they encode (ADC30690-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; an antibody against a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of geventing, traating or ameliorating a medical condition; Atts comprising polymuclectide probes and/or monoclonal antibodies for carrying out the methods of the invention. The invention methods for the identification of compounds that modulate the expression or activity of the polymuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are expression or activity of the polymeptides encoded by the contigs (ADC33627) and the polypeptides encoded by the contigs (ADC33627) and the polypeptides of the invention are identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and animo acid sequences. The nucleic acids may also be used as hybridisation probes or carcer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides and as food supplements. The present sequence represents a specifically of are also useful in generating antibodies, as molecular weight markers, and in the recombinant production of the invention. Note: The sequence data for this patent did not form part of the prime

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer.

Example 2; SEQ ID NO 3234; 1185pp; English.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polymucleotide probes and incention; methods for the invention of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the expression or activity of the polymucleotide and/or polypeptide; and 767

```
contig sequences corresponding to the cDNA sequences of the invention (ADC13161-ADC132627) and the polypeptides encoded by the contigs (ADC13028 and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmume diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a human contigencoed polypeptide sequence used in an example of the printed sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. wipc.int/pub/published_pot_esecons.

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly 1-1ysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                66 HSGIIBELGIGAHGLRYIDCDPWARAPA---PGTDGPGIVFHRDLDATCQSIERACGTK 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated polypeptide having carotenoids isomerase catalytic activity, computating a sequence at least 78 % similar to a 615 residue CRTSO amino acid sequence, given in the specification, as determined using the Standard protein-protein BLAST (blastp) software of the NOTSI. The novel polypeptide is useful for producing the all-trans geometric isomers of cis-carotenoids, including phytocene, phytofluene, zeta-carotene, neurosporene and lycopene. The polypeptide enables carotene, neurosporents in the dark and in non-photosynthetic tissues. This sequence represents a synechocystis protein relating to the carotenoid isomerase catalytic polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NLIGAFGGLA--TARGNSELSRQFLAPGDALLDEYFDSEALKAALAWFGAQSGPPMSEPG 210

```
The present sequence represents a Phaffia derived carotenoid biosynthesis pathway enzyme. The nucleic acid encoding this protein can be used in the novel recombinant DNA of the present invention. The recombinant DNA comprises a transcription promoter operably linked to a downstream sequence to be expressed, where the transcription promoter comprises a region found upstream of the open reading frame (ORP) of a highly expressed Phaffia gene (preferably GAPDH, a ribosomal protein gene, an

enzyme involved in the biosynthesis pathway). The recombinant DNA can be used to transform hosts, preferably Phaffia. These transformed hosts are then used in the recombinant production of GAPDH or an enzyme involved in carotenoid synthesis, preferably astaxanthin. They may also be used to produce a pharmaceutical product. Purified carotenoids can be used as colourants in food and/or feed, and also in cosmetics. (Updated on 17-OCT-2003 to standardise OS field)

Ŕ 615 AAO22614 standard; protein;

AA022614;

(first entry) 15-MAY-2003 Tomato plant protein, SEQ ID No 15.

Carotenoid isomerase catalytic activity, CRTISO; cis-carotenoid, all-trans geometric isomer; phytoene; phytofluene, zeta-carotene, neurosporene; lycopene; plant, dark, non-photosynthetic tissue, enzyme;

Lycopersicon esculentum

WO2003008534-A2

```
The invention relates to a novel isolated polypeptide having carotenoids isomerase catalytic activity, comprising a sequence at least 75 % similar to a 615 residue CRIISO amino acid sequence, given in the specification, as determined using the Standard protein-protein BLAST (blastp) software of the NOTBI. The novel polypeptide is useful for producing the all-trans geometric isomers of cis-carotenoids, including phytoene, phytofluene, zeta-carotene, neurosporene and lycopene. The polypeptide enables carotenes in plants in the dark and in non-photosynthetic tissues. This sequence represents a tomato protein relating to the carotenoid isomerase catalytic polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        298 ALQTPMINASMVICDRHFGGINYPVGGVGEIAKSLAKGLDXHGSQILYRANVTSIILDNG 357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NHWTVTTESGREVHARKVIAGCHILTTLDLLGNGGFDRTTLDHWRRKIRVGPGIGAVLRL 324

                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to enzymes involved in a carotenoid biosynthetic pathway and DNA sequences encoding the polypeptides. One polypeptide has the activity of catalyzing a reaction forming geranylgeranylgyrophosphate from farnesylpyrophosphate. Another polypeptide has an activity of catalyzing a reaction forming phytoene from geranylgeranylpyrophosphate. The DNA can be used for the preparation of carotenoid. The present sequence represents an enzyme of carotenoid biosynthetic pathway

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane construction and membrane transport (MCT) proteins given in AAB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation. AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14 AVVIGAGVAGLATSALLARDGWQYTVLEKNTDVGGRAGSLEISGFPGFRWDTGPSWYLMP 73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               443 TPRDIESELGMIGGNVMHVEMSLDQMMLWRPLPELSGHRVPGADGLYLTGASTHPGGGV 501

```
construction and membrane transport (KCT) proteins given in AAB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation.

AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention
                                                                                                        AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Canthaxanthin biosynthesis by the conversion of methylene to keto groups in a hydrocarbon beta-carotene by a single gene.";
Biochem. Biophys. Res. Commun. 209:867-876(1995).
-!- FUNCTION: Catalyzes the hydroxylation reaction from beta-carotene to zeaxanthin via beta-cryptoxanthin (By similarity).
-!- PATHWAY: Carotenoid biosynthesis. Involved in astaxanthin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8 LIVEVIVVGMEVVAALAHKYIMHG-WGWGWHLSHHEPRKGAFEVNDLYAVVFAIVSIALI

                                                                                                                                                                                        -i- PATHWAY: Polyunsaturated fatty acid biosynthesis.
-i- SUBGELLULAR LOCATION: Endoplasmic reticulum.
-i- DOMAIN: The histidine box domains may contain the active site and/or be involved in metal ion binding.
-i- SIMILARITY: Belongs to the fatty acid desaturase family.
cytochrome b5 as an electron donor and to act on fatty acids esterified to phosphatidylcholine and, possibly, other phospholipids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PIR; A44227; A44227.

                                                       detectable in root tissue.
-!- DOMAIN: The histidine base domains may contain the active site
and/or be involved in metal ion binding.
-!- SIMILARITY: Belongs to the fatty acid desaturase family.
                    TISSUE SPECIFICITY: Abundant in leaves and seedlings. Barely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pfam; PP00487; FA desaturase; 1.

Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Microsomal (ER) omega-3 fatty acid desaturase introduces FUNCTION: Microsomal (ER) omega-3 fatty acid desaturate bond in the biosynthesis of 18:1 fatty acids, important constituents of plant membranes. It is thought to use cytochrome b5 as an electron donor and to act on fatty acids esterified to phosphatidylcholine and, possibly, other phospholipids.

PATHWAY: Polyunsaturated fatty acid biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

-!- FUNCTION: Chloroplast omega-3 fatty acid desaturase introduces the third double bond in the blosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron donor and to act on fatty acids seterified to galactolipids, sulfolipids and phosphatidylglycerol. PATHWAY: Polyunsaturated fatty acid biosynthesis.
-!- PATHWAY: POLYUNBARIATURE.
-!- DOWALN: The histidine box domains may contain the active site and/or be involved in metal ion binding.
                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                   three double bond in the biosynthesis of 16:3 and 18:3 fatty acids desaturase introduces the third double bond in the biosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron donor and to act on fatty acids esterified to galactolipids, sulfolipids and phosphatidylglycerol. PATHWAY: Polyunsaturated fatty acid biosynthesis.
-- SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).
-- DOMININ: The histidine box domains may contain the active site and/or be involved in metal ion binding.

Vature 408 820-822 (2000).

Vature 408 820 Chloroplast omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron donor and to act on fatty acids esterified to galactolipids, sulfolipids and phosphatidylglycerol.

VENTRARY: Polyumaturated fatty acid biosynthesis.

VENTRARY: POLYUMSATURED GATTON: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).

VENTRARY: SPECIFICITY: Wost abundant in leaves and seedlings.

VENTRARY: The histidine box domains may contain the active site and/or be involved in metal ion binding.

SIMILARITY: Belongs to the fatty acid desaturase family.

(Oxidase BO(3) subunit 1) (Cytochrome O ubiquinol oxidase subunit 1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and copper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Buchnera sp. APS.";
Nature 407:81-86[2000].

-!- FUNCTION: Cytochrome O terminal oxidase complex is the component of the aerobic respiratory chain that predominates when cells are grown at high aeration. This ubiquinol oxidase shows proton pump activity across the membrane in addition to the electron transfer (By similarity).
-!- CATALYTIC ACTIVITY: Ubiquinol-8 + O(2) = Ubiquinone-8 + H(2)O.
-!- COPACTOR: Contains two protoheme IX (heme BS5 and BS62) and copper B (By similarity).
-!- PATHMAX: Ubiquinol oxidase catalyzes the terminal step in the electron transport chain.
                                                                                                                                                                                                                                                                                                                                                                                                           18 EVVAAL-AHKYIMHGWGWGWHLSHHEPRKGAFEVNDLYAVVFAIVSIALIYFGSTGIWPL

-!- FUNCTION: Cytcohrome O terminal oxidase complex is the component of the aerobic respiratory chain that predominates when cells are grown at high aeration. This ubiquinol oxidase shows proton pump activity across the membrane in addition to the electron transfer "...imilarity).
